

TUL

Transurethral lithotomic procedure removes stones in the urethras. The doctor will use a thin scope to search for the stones and to remove stones. In this procedure there is no need for cutting in your skin. The scope will be passed through your urethra and then urethra to reach to your kidneys by your doctor. The doctor will use a small basket for small stones removal. The doctor passes a laser to remove or to break large stones and this procedure doesn't need a long hospitalization
